

DESKTOP PUBLISHING SOFTWARE

Good DTP software is the life force of the publishing industry, be it print or online. They're however very expensive to buy. But OSS can give you the same results.

DTP or Desktop Publishing basically is the use of DTP software for laying out pages to create documents. This software provides more control over the design, layout and typography than word processing software. Using DTP software, you can publish a wide range of printed matter – ranging from something as small as visiting cards to giant billboards.

The first DTP software was developed way back in 1983 and called 'Type Processor One'. It was commercially available in 1984 and since then has continued to evolve. One particular software that captured a large share of the market was Adobe's InDesign. It continues to be famous today, and has a lot of competition considering the wide application of desktop publishing software. POS displays, retail packages, outdoor signs, books, ebooks and digital publishing are some of the applications of the software.

However, proprietary DTP software can be quite expensive, and if you're looking to save costs, then there are many Open Source options available as well.
