

Deciding your needs :

You don't NEED a high-end powerhouse as a rig. Often enough, even the bare minimum of components is enough to get you going. At other times you do have to spend some money but you can spend it on more worthy components depending on your needs instead of just splurging on all high-end parts. Therefore, it's of paramount importance that you decide the kind of work you're going to be doing on your rig before you assemble one.

Another thing we ought to mention is that often there are components that are tailored to perform specific tasks, so you can get even more specific. For example, the Quadro graphics cards NVIDIA manufactures are meant only for graphic designing and similar tasks. Sennheiser makes monitoring headphones like the HD-280 Pro for precise audio editing. In the coming pages, you'll read up about the three kinds of rigs we've put together and read more about these kind of components.

RIG #1 : The everyday performer :

Cost : approx ₹30,000/- excluding monitor and speakers.

Usage : Minimalistic.

This one is for those people who want a bit of everything without spending too much money. Things like using an office suite, burning DVDs, web designing would fall under this category. You can even perform some basic image editing. The priority here is to make a simple PC without too much hassle. Below is a summary of some important parts to consider. Do keep in mind that These are the most important factors to consider while building any sort of PC and so we'll talk about these in detail.

- ◆ **CPU** : Since the workload is going to be relatively less, don't splurge here. For example, using a simple Intel Core i3 3220 and subsequent motherboard would help. Here in this rig we chose the AMD FX-6300 as it outshines the i3 3220 in benchmark tests and reviews.
- ◆ **GPU** : It's no secret that the price of high performance graphics cards can get exorbitant. Since you won't be doing much gaming, it's possible to not use any graphics at all. In any case, your CPU does come with integrated graphics that can manage small tasks.
- ◆ **Primary memory** : The RAM requirements for this PC would be minimalistic and so 4 GB of RAM should suffice.

Below is a table with a suggested PC build for basic tasks, with the total cost (monitor and speakers not included).
