

the AMD FirePro series. They do turn out to be a bit more expensive than conventional graphics cards but it all pays off in the end. Another trick is to pair up two or more graphics cards for extra performance.

Now that's some rig!

- ◆ **Faster processors** : While you might get away with a mid-range processor, most multimedia applications are optimised for multi-threaded processors and the more threads they get to work with the better the performance you get. An Intel i5 or i7 Quad core processor should be able to do the trick
- ◆ **Solid State Drives** : Solid State Drives are a big upgrade in speed over a HDD. They have the ability to wake the PC up from a sleep state immediately. They also generally boot programs faster. They are almost always more expensive than HDDs though, and come in smaller storage capacities.
- ◆ **Primary Memory** : Here is where you'll be needing a large amount of primary memory. At least 8GB-16GB of memory is required to ensure smoother running of the system.
- ◆ **Monitor** : A simple HD LED monitor would suffice here, since you're creating the graphics and not reviewing them. However do check the color reproduction and refresh rate of the monitor. Some people believe that adding a dual-monitor display for graphics development adds to productivity. This is a practice commonly followed by professional gamers and animators. Depending on which monitors you buy, the cost might remain the same if you're buying a single larger 27-inch monitor.

With the above in mind, here's a table with components for a graphic-intensive PC (monitor and speakers not included) :

Build parts	Cost(INR)
Intel 4th Gen Core i7-4770 Quad-core processor	22,002
MSI Z97 PC Mate LGA 1150 Motherboard	8250
HP NVIDIA Nvidia Quadro 2000 1GB DDR5 Graphics Card	19,999
2x Corsair Vengeance 8 GB DDR3 Memory Kit	8898
Cooler Master Power Supply B500 500 Watts PSU	3380
Samsung 250GB 2.5" 840 EVO SATAIII SSD	9390
Corsair CC-9011014-WW Carbide Series 300R PC Gaming Case	12,899
TOTAL :	84818
