

This system does come with its own pros and cons, as seen below.

PROS :

- ♦ Extremely powerful : This can stay as your sole workstation for years to come.
- ♦ There's no need to upgrade for a long time to come.

CONS :

- ♦ Cost : Workstations like these are very hard on the wallet. Expect to shell out even more if you're going after things like larger monitors or more than one graphic card.
- ♦ Maintenance : It's not easy to maintain such an extensive system. Repairing this kind of system is also going to be an expensive affair.

RIG #3 : The Movie Maker

Cost : Approx ₹1,60,000/-

Usage : Video Editing

The components of this rig and the previous rig don't differ much. This rig mainly focuses on having a good visual and sound experience. Keeping these in mind, the processor and graphics card aren't exactly top end, but they'll do the job. For a good movie and audio workstation, you should consider the following components:

- ♦ **HD Monitor** : For a lot of video editing work, buying a HD monitor is a huge leap when reviewing videos. There's a wide variety of monitors with different screen panels, mainly the IPS(In-Plane Switching) panel and TN(Twisted Nematic) panel. TN panels are everyday consumer panels and are also cheaper. The IPS display generally has better viewing angles and good color reproduction. They are also very expensive comparatively. There are also sub-variants of IPS displays like p-IPS (Professional IPS) which have an even better color reproduction than standard IPS monitors and are obviously more expensive.
- ♦ **Better processor** : The processor used in this build and the previous build are the same Intel i7. They differ when it comes to generations. The 5280 is a generation newer than the 4770 and has 6 cores and 12 threads, double that of the 4770k. At an added cost of only around ₹5000/-, this is a worthy upgrade.
- ♦ **Audio-enhancing headphones** : The two main categories of headphones are circumaural headphones and monitoring headphones. Circumaural
