

headphones are the everyday-usage headphones, and are designed with comfort in mind. Monitoring headphones take away distractions (known as color) from the audio to deliver better sound quality. You can also use an amplifier with the headphones to deliver

A GPU that's specially designed for rendering

amplified sound. Headphones amplifiers are different from normal amplifiers and cost a lot more because of their capabilities.

- ◆ **Sound Card** : While an onboard sound card usually works well enough, adding a proprietary sound card improves the audio exponentially. You can get either external sound cards, which can be attached via USB. They work well when paired with a high-end external amplifier. For other cases, an internal sound card, which works with the PCI-E bus, is the best buy.
- ◆ **Graphics card for video** : Again, there are a number of graphics cards on the market which are capable of video reproduction better than others. The Nvidia Quadro K6000 is one example. But these are extremely expensive and sometimes the average graphics card would serve the purpose for you. Here, we decided to go for the Nvidia GTX 970 as compared to the Nvidia Quadro K2200. Both are almost similarly priced but the 970 outshines the Quadro when it comes to benchmarks. At gpu.benchmarks.com, the 970 has a score of 90 compared to a score of 50 for the Quadro.

Keeping the above in mind, here's a rig for video/audio production. We decided to include the price of the monitor in this build because it's an integral part of your purchase :

NVIDIA QUADRO
