

```

• Tag Cloud
• {% endblock %}
• {% block content %}
• <ul>
•   {% for tag in object_list %}
•     <li style="font-size: {{ tag.num_articles }}pt;
•       display: inline-block;">
•       <a href="{% url 'tags-detail' tag.slug %}">
•         {{ tag.name }}
•       </a>
•     </li>
•   {% endfor %}
• </ul>
• {% endblock %}

```

Even if you forgive our use of inline style — which you should always strive to avoid — this is a rather naive implementation of a tag cloud. In this above implementation the font size of a tag is equal to the number of articles that have that tag. You can probably imagine what will happen when there are thousands of articles, with tags that have been applied hundreds of times.

A proper tag cloud system would clip the range of font sizes to something more reasonable, so the largest tag sizes aren't hundreds of points and the smallest ones are unreadably small.

auth/user_detail.html

```

• {% extends 'site_base.
html' %}
• {% block title %}
•   Author: {{ user.get_full_name }}
• {% endblock %}
• {% block content %}
•   <header>
•     <h1>Articles by {{ user.get_full_name }}</h1>
•   </header>
•   <section>
•     <ul>
•       {% for article in user.article_set.all %}
•         <li>

```
