

Upgrade Pains

Neither of these would have been a problem if users had some control over updates. For the case of drivers Microsoft has released a tool that users can use to blocks certain driver updates – which in previous Windows versions had been optional. However for security patches that go wrong, there isn't any way out.

We've talked about how keeping security updates mandatory is a good idea even if it negatively affects a few computers. However the solution isn't for those people to just be collateral, after all one update might affect 0.1% of users, but over hundreds of updates over the years, the number of people negatively affected by at least one update will grow. Microsoft needs to be able to manage this better. It's still new for them, so we can hope they will figure things out.

Firefox has been updated while it was still running. No biggie, just restarting Firefox will start using the new version.
