

UX design and UI design

subset of Experience. If a product looks good but is a pain to use, it has great UI and bad UX, whereas if it works great but doesn't look too good, the roles have changed (bad UI, good UX). They are different, but both are important.

UX != Usability

Though it may appear that UX was born out of Usability, they too are separate concepts. By focusing on Usability one tries to make the product easier to use, but that does not necessarily translate to the product becoming better to use, which is the domain of UX. Also, a good looking interface (good UI) doesn't necessarily imply ease of use or user-friendliness (Usability). A good UX takes far more effort to create than good UI and Usability by themselves. Thus Usability, UI and UX are all different and not always causally related. Making a good UX design is about more than just making the design Usable. It should also make the design pleasureable, seductive, and if possible, downright addictive (sounds a lot like *ahem* time). Sometimes the design needs to be made less Usable in order to have a better user experience. After all, in certain contexts people do get satisfaction from discovering things on their
