

ness. If the users aren't achieving their goals, then you have no users and obviously no success.

Moreover, you have to design within a context, such as technological or resource limitations that provide a constraint. Not to mention, during the whole process of UX Design, you must communicate effectively with the client or stakeholders, as well as the various members of the team who may be playing very specific roles, such as the programmers, UI designers or copy writers.

The Basic Process of UX Design

UX Design always begins with Research, and ends with Research, with a little bit of Design in between. A UX designer must be involved in the development process from the start, while conceptualizing using the requirements of the client and assembling a capable multi-disciplinary team. This is the Analysis phase. This is accentuated by some field studies to get some real world info on potential users that will help decide on a design strategy, along with creation of user profiles, use case scenarios, et al. This will help in the next phase which is the Concepting and Design phase. Using the information gained so far, the team brainstorms the working and features of the product. This is accompanied by the creation of lo-fi prototypes and other deliverables (sitemaps, wireframes, mock-ups) which are useful for usability testing and some more user research. Next comes the Implementation phase with some real world usability tests of the almost finished product. Even though the product will forever be 'almost' finished, we move on to the next phase, Deployment, once the usability objectives are completed. The final product is deployed and more user feedback is collected which is used to further improve the product in successive iterations or in the form of updates. All of these stages consist of particular methods and deliverables which we will now discuss in detail.

The Basic Process of UX Design: In Detail

Since this is a Fast Track to UX Design, why not picture yourself as a UX Designer already! This will make it easier and more literally like a Walk-through. The deliverables start with a Capital Letter..

Analysis

You have just taken on a project from a client, so the first thing you do is meet with them. Once you have set the vision you need to get yourself a
