

Card Sorting - Bringing order to chaos

team of competent professionals, unless you are the master-of-all trades Swiss-Army knife of software/web development. Next you should conduct some formal Stakeholder Interviews, so that you can gain further insight on their goals and decide on the Key Performance Indicators (KPIs). The KPIs are just established criteria that will help you measure your success, like milestones of progress towards strategic goals (or it can also be a refurbishing of operational goals). The next part is the Field Studies that can be in the form of Surveys, Focus Groups or User Interviews, that give you the raw data for assembling your user profiles (Personas), which is covered in Chapter 3. You can sift through the (hopefully) large amounts of data using techniques like Card Sorting, which is writing down related pieces of information on cards and then physically grouping them into categories based on the information on them.

As a rule of thumb, the more comprehensive your research, the better your product is likely to be. The Personas that you end up fabricating in turn help with creating a Customer Journey Map or a User Story. A Customer Journey Map is a visualization of the progression of touchpoints as the user uses the product or service and the motivation behind the decisions, while a User Story is almost the same thing, but documented
