

Concepting and Design

Now that you and your team have a general but firm idea of what the product should be like, it is time to Brainstorm the exact features and designs that communicate the intended experience to the Users while providing the expected functionality. At this point you can create a Moodboard, which is a collection of pictures that convey the ‘feel’ of the product. The Moodboard is also useful to confirm the intended communication (to the users) with the client. Next, it will be helpful to sketch out a few Storyboards so that the programmers and designers can empathise with the users and get a virtual idea of real-world usage.

Drawing a Storyboard

After everyone on your team has a concrete idea of the functionality and thus, the features required for the users to accomplish certain tasks, it is time to create a User Flow, which is basically a visual representation of the actions the users have to take while performing those tasks. This also gives a rough idea of the organization of the site, which can be used as a hint while designing the Information Architecture later on. This is a good time to finalise on a Features Roadmap, which is a diagrammatic representation of the intended features and evolution of the product. Now it is time for a
