

contains as much of the design elements as possible and also some of the functionality. Once again, it is time for more Usability Tests.

Be careful not to prompt your Test subjects as the Mock-Up is supposed to contain all the visual elements, and thus should convey the message or functionality to the User. If you find that the User is in need of prompts, conclude that your User Interface is in need of redesign. Keep Testing and Redesigning. You can even use tools like Eye-Tracking software to see if your

Prepare to be doing this.. A lot!

visual design successfully guides the user's attention as you planned, or even to visualize their scanning or reading patterns. High-fidelity prototypes can be created to demonstrate the function of the product, which might be useful to show progress and confirm satisfaction with the client. Once you have successfully tested your best prototype, document your Guidelines and Standards and create a Design Specification so that you don't have to do all that research again. On to the next phase!

Implementation

In this phase your team builds the actual product, which should be a piece of cake after all the prototypes that must have been made. This is accompanied by a Heuristics Analysis and a Content Audit. The Content Auditing process is basically listing all the content available on your website. The
