

FROM DEFINING TO DESIGNING THE PRODUCT

Now that you know what your users want, how do you give it to them?

These three steps will take you closer to your finished product

The second step in User Interface (UI) Designing after identifying the needs of the interacting user is UX Designing. This design is based on the “how, who, when, where, why and what” of user interaction. For example, if you’re designing a website for a clothing line, which is women-centric, you’ll optimise the UI to cater to the needs of the target women. So you’d want the colors to be a little cheeky and vibrant, rather than bold and dark which usually appeals to men.

To enhance user interactivity and experience, we use three techniques, i.e. Prototyping, Wireframing and Mockups.
