

A prototype of an interactive UI

product using a digital environment. It can be an interactive or non-interactive model of the actual interface.

Mockups

A 'mockup' is a realistic representation of what the final product will look like. It's used for demonstration, design evaluation, promotion and other purposes. Mockups are basically functional prototypes built on top of wireframes that go further into detail to show overall appearance of a design including type and color choices, among other things. It provides at least part of the functionality of a system and enables testing of a design. While some people prefer to draw the mockups using graphic software, others do it straight away in HTML/CSS. What matters is the goal of a mockup – to show, as closely as possible, how all final appearances will be rendered. The final interface can look exactly like the mockup, or be a variation of it after version revisions.
