

2. Pixate: Want to design only mobile or tablets apps? Try out ‘Pixate’. We tested Pixate Studio version 1.7.0. It’s highly customisable and helps design mobile, smartwatches and tablet apps. There are a bunch of preset resolutions for popular devices such as the Nexus 5, Nexus 7, Apple smartwatch and so on. You can also customise the resolution as per your requirement, but there are no preloaded widgets available. You need to create your own assets and add them to the interface. Pixate will help you add the required interactions and animations to create the run-time interface of the app.

Cost: Free (Studio version), \$5/month (Cloud sign up)

Pixate runtime interface

3. UXPin: Don’t want to download desktop-based design software? Just use ‘UXPin’, the cloud-based design tool which comes with a 7-day trial. It has all the functionalities of a traditional desktop-based mockup tool – from preloaded widgets to asset addition. The highly interactive “smart elements” are the main highlight of this design tool. The smart element feature lets you create complex, recurring element combinations once and just transfer them to your prototype with the single click of a button as many times as you want.

Cost: \$19 per user/month (Basic), \$29 per user/month (Pro)
