

Adobe Fireworks runtime interface

Wireflow runtime interface

1. Wireflow: 'Wireflow' is an Android app which lets you create low fidelity wireframes, with shapes only. We tried version 1.1.9. The interface is really simple to use with its shapes and pre-defined interactions only.

Cost: Free

2. Marvel: Have an idea on a piece of paper and want to convert it into a prototype? 'Marvel' to the rescue! It can help you create low fidelity prototypes. We tried version 1.8.5. The functions are really simple, all you have to do is take an image of the paper wireframe

or import it from Dropbox or other cloud service and add interactions to it by creating hotspots.

Cost: Free
