

Marvel runtime interface

Pixate runtime interface

3. Pixate: Yes, it's the same as the desktop app. We tried version 2.8.1 on Android and version 2.8 on iOS. It isn't a fully-fledged wireframing app on mobile devices. However, in combination with the desktop software, the app has a feature distinguishing it from other apps, i.e. its ability to let you see real-time app changes to the interface design on the desktop application and vice versa.

Cost: Free

4. Justinmind: This is also an add-on app like Pixate. We tried version 1.0.2 on Android and version 1.0.5 on iOS. It doesn't have the "live update" option like Pixate, but allows you to share your prototypes from the desktop application which can be viewed in the mobile app. If you're worried about the security of your prototype, worry not. To view it on a device, you must download the prototype every time from the Justinmind cloud.
