

We've watched users (sometimes for hours) doing or not doing anticipated actions. Users form the spine of our interactions. They interact and hence we design. User Experience design is thus about winning the user's heart by designing simple, easy-to-use interfaces that encourage interactions. Luckily more and more technology companies are awakening to the need of stunning, precisely designed user experience. We're starting to move to whys and hows of user's behaviour, instead of sticking to whats. We take time to analyse why users perform certain actions on our application and how they perceive certain information, instead of sticking to what number of people leave that page.

As the demand for good User Design is rapidly increasing, the field of UX is also growing.

UX has grown from just creating layouts of pages and taking them out for user research to participating in discussions of UX and digital business strategy. UX has seen it all, from desktops and tablets to smartphones. I believe that the future of UX is exploding, and it is bursting to birth its new avatar, which will be delivered to us in various shapes and numerous dimensions.

Below are some things we think are pertinent to UX and its future:

## 1. User Experience teams won't be handed a part of the product. They'll lead the product.

UX teams will no longer be handed the part of the product that needs layouts, graphics and user research. Instead, User Research teams would lead the product by defining user needs, gaps, iterations, next generation

User Experience teams leading the product
