

much larger audience via the power of the internet. UX designers would need to be equipped with tools to harness the power of the crowd. Online and remote testing tools would become important to reach out to a larger audience and gather their feedback, ideas and suggestions.

5. Customised / Personalised experience

Experience will no longer be generic. My son won't see what my old, senile neighbour will see when they open the same online shop. The shops will recognise and serve them with crafted and personalised products, promotions and graphics based on big data.

I love movies, and if it weren't for personalised recommendations thrown at me by Netflix and the likes, I'd never discover movies that I should have watched but never knew existed.

6. Anticipating user's needs

The user's needs would be anticipated and met. For example, if he picks up a reading app, it will automatically pick up where he left off no matter which device he was reading on last. He wouldn't have to hunt for the last page where he stopped reading.

Anticipating Users needs

If the user entered a kitchen, there would be an automatic alarm on his phone warning him of rotting vegetables and fruits since they haven't been consumed even after six days of purchase.

Predicting user's behaviour and creating a smooth, enjoyable experience would be mandatory.

7. Artificial Intelligence

Artificial Intelligence has come a long way, from helping us find a location when we're lost on the street (Google Maps) to ordering food from any of
