

Conclusion

User Experience and its body of knowledge is in itself undergoing changes as is the user and his behaviour towards technology. As more people embrace technology, the challenge isn't making users aware of certain functions, the challenge now is making users unaware of the function and letting the function automatically happen.

I strongly believe (and I have reasons to!) that with UX taking the forefront, the digital world will be a happier and contented place. However, the future can't be predicted precisely, and that's a good thing, because if we were certain about the future, we wouldn't be able to change it. The whole point of forecasting is to give insights, which allow us to make the future better! 

Note about the author

This chapter has been contributed on invitation by Neha Modgil, Global Design Head – Techved Consulting.

Neha (B Architecture, Masters in Design, SPA) began her venture in 2007 with a small group of design professionals to provide website solutions, however with a sudden boom in the demand for internet & smart phones, Neha then decided to provide complete solutions to her clients and included software, mobile app designing & digital marketing solutions. Neha rose from being a Consultant to an owner of a start-up company of the few people to an entrepreneur of a company with strength of 100 employees.
