

Wearables present an interesting situation where the goal is to some drastic enhancement in life experience for the consumer with as little behavioral changes as possible.

‘How can I get more accomplished and also live a better, more satisfied life style?’ is the question that is on the rounds and wearable technology has been changing people’s lives for many decades, some people we may know and simply haven’t realize it, like anyone who works in security management, is hearing impaired or someone who wears a prosthetic (a limb for example). In that way, the setting up of a wearable market where we can buy enhancing machines and gadgets in a way identical to how we buy mobile phones or clothing accessories, changes the criterion for the personal aspect of computing and our living experiences in some thrilling ways.

The age of the wearables is upon us and it's an exciting time ahead for the evolution of technology gadgets as we know it

All of these possibilities will be facilitated by the Internet of things (IoT), providing rich and invaluable connections among people, process, data, and things. And this is just the beginning. As new technology continues to seem to be smaller, cheaper, and more powerful than ever before, and as the amount of interconnected devices on the planet grows in the upcoming
