Health and Fitness

Medical devices is a term that covers the variety of products that are generally worn on the body for a prolonged period of time and are able to capture information about the patient's physiological condition and then process or calculate the correct medical procedure to be followed before obviously notifying the patient.

The devices currently under development include vital sign monitors like for the heart rate and respiratory rate. Apart from having a lot of medical significance, these devices are also seen as having increasing roles in the training and upkeep of athletes and general fitness enthusiasts.

As mentioned previously, developments in wearable medical devices are also expected to enable remote monitoring, such that a patient does not have to resort to reporting to the doctor in person or vice versa, they can be monitored by the clinic while remaining comfortably at home while even constantly reminding them to take their medication.

On the other hand, the most common fitness device connect to smartphones, tablets or laptops to track the user's health status including such data as BMI, blood alcohol level, heart rate and may even include a posture coach.

Another significant use of vital data tracking could be attachment of small sensors in the body to follow the patient's health records such as ECG data, heart activity and breathing, allowing doctors to monitor their patients without actually being present, all the need to do is regularly access the information on their specialized cloud based portal.

A variation of sensors could be the ingestible kind which have the added utility of being a quick, easy and cost effective way to provide real time data of the efficacy of drugs and medication in the body.

Wrist Wearables

A large chunk of health and fitness wearables are wrist wearables. Fitness bands and other wearables have clearly been embraced enthusiastically by the the current market that caters the the more health conscious, tech savvy consumer. The commercial viability of the wearables like the Nike Fuelband and the Fitbit is what experts would call the tip of the iceberg.

Fitness trackers come in varying degrees of sophistication apart from
