

Wearable tech's fitness benefits are most popular among consumer

varying in terms of shape and size themselves, but so far have usually been bands and watches who's most common feature is make a count of how many steps we take in a certain amount of time. The newest bands have the additional features of continuous heart rate monitoring and calorific burn.

Smartwatches are mini-windows into your digital life at the turn of your wrist. Apart from being able to tell the time, they can also show the user their emails, messages and other aspects of their digital social life.

Head Mounted Displays

How does one deliver virtual information right to our eyes? Head mounted displays are what we'll need. Some of them are designed to block out peripheral vision, i.e. the rest of the world. A computer generated virtual reality could literally fool our brain into thinking it's somewhere else entirely.

Oculus Rift is the big name in virtual reality although both Sony, with its Project Morpheus, and HTC's Vive are causing much excitement.

Google Glass was released in 2013, the first product to combine voice operation with a head mounted display. It also has hands free internet
