

Coming to the sense of sight on the other hand, Google Glass and Hololens are at the forefront of new wearable technology capable of augmenting sight but we would never think of these as being a form of prosthetic.

These wearables are also being used in rehab centers to help people who need to recover from stroke or surgery. Initially, the development of wearable robotics focused mainly on military and medical applications.

Is the wearable tech industry really the next big revolution, and all set to boom in mainstream popularity, rather than fade away into tech-fad obscurity? We certainly think so.
