

THE EVOLUTION OF WEARABLES

In the last chapter we gave you a small glimpse into the history of wearable technology. Here's the whole story.

From viewing computers as devices exclusively meant for high-intensity computations to holding such computing powers in the palm of your hand, the attitude towards computing devices has changed in the past six decades or so. So much so that it's common enough these days to have devices with immense computational powers to be worn as part of body attire-sometimes displacing ornaments and at other times, complementing them. But wearables have a back story which goes far back into the past-to centuries before Alan Turing conceived his Turing machine which more or less laid the foundation for modern computers.

The story, when told in the narrative arc of wearable's evolution is as amusing as it is enlightening. Shedding light on not just the dominance of human ingenuity down the ages but also the almost organic manner in which one thing leads to the next, even when the next step in question is highly removed from anything organic.

The first ever truly wearable 'tech' product that man produced was the humble eyeglasses. Though the identity of the inventor remains unknown,
