

it's widely believed that the invention was made the 13th century in Venice. The earliest users of the device were probably Christian monks since during the period clergymen and monks were the literate class while lower classes were limited to farming activities and were generally unlearned.

The first time the world saw wearables was with a device of sight.

Glass blowing was an art the Venetians were excelling during the time and reading glasses were a result of the ingenious skills of the glass blowers who applied their acumen to produce reading stones using solid glass. The evolution from these hand-held single lens to the reading glasses set into bone or metal and balanced on a monk's nosebridge didn't take long. And in a painting by Tomasso da Modena that the artist created in 1352, we have the very first artistic representation of a pair of eyeglasses.

Time-keeping was an idea that was to revolutionise the way in which humans engaged in wealth creating activities. The ability to mark time with a high level of precision not only told employees when it was time to leave work but also enabled employers to keep track of the amount of work done

A time-keeping device ahead of its time
