

Natural drones?

on the pigeon's body so that he could observe what goes on in other parts of the land.

The camera in question was usually made using wood and weighed anywhere from 30 to 75 grams. Pigeons were given special training to carry the load and they would fly at a height averaging 160 to 330 feet. The camera's time delay mechanism was made possible by the pneumatic system attached to it.

The Roulette shoe in 1961

One of the wackiest inventions ever made by mathematicians, the Roulette shoe was essentially a miniature computer that fitted inside a shoe. Its purpose, as you may have guessed was to help the wearer win at a game of roulette. The device was invented by Edward O. Thorpe- a Mathematic professor along with Prof. Claude Shannon- who is considered as the father of information theory.

The idea was something which Thorp had been carrying around in his head ever since he was young. However, it was only when he met Shannon in his adult life that the plan came to fruition. The acquaintance with Shannon not only gave Thorp the benefit of a highly scientific mind to help him but also gave him access to the IBM 704- a machine which at the time was the cutting-edge of technology.
