

of the fact that computers were still mostly used by organizations rather than individuals. It was not until three years later when Apple introduced the Macintosh in 1984 that the PC became a device of choice in households. Maybe, if Seiko had waited that long, it would have been a different story altogether.

Nelsonic Space Attacker Watch in 1984

Introduced in 1984, the Nelsonic Space attacker watch coupled as a time-telling device as also a game playing unit. A collectible item for game enthusiasts these days, the watch had a pretty large display that would display the time along with information regarding the day, time, month, am/pm and the alarm status all in one go. With a simple push of a button, you can change the display into a miniature game monitor- albeit the fact that you could play just one game in it- Space Attacker. The game could be played using just two front buttons in the watch- the left button to move your turret and the one on the right to shoot at the attackers from outer-space. The catch was that if the attackers had you the first three times around, the earth is lost!

Any time is good for a fight!

The fact that arcade games were steadily gaining in popularity during the time in the U.S as well as the widespread use of wristwatches- unlike the present day when we are content with the time-telling abilities of our mobile phones meant that these watches found their share of savvy users.

The head mounted screen- 'Private Eye' in 1989

It seems that every contemporary piece of wearable technology has a predecessor. The Private Eye introduced by Reflection Technology was a prelude to Google Glass. By scanning a vertical array of LEDs along a visual field with a vibrating mirror, the head-mounted display would feed you visuals the kind of which the world had never seen before. The display was 15- inch long and was mounted at a distance of 18 inches.
