

powered jackets for both men and women was introduced as a limited edition offering in 2014.

The jacket allows the wearer to charge cell phones etc. using power from the solar cells embedded in the jacket. The mechanism makes use of a chord in the lining of the jacket that is connected to the solar panels which are found on the back of the garment. The chord connects the panels to a removable battery pack that's found in the front right pocket. The solar panels were made using flexible silicon technology. If exposed to full sunlight, the cells would enable the charging of a 1500 mAh mobile device for up to four times. The presence of two USB ports in the pack means one can plug in multiple devices simultaneously.

One watch. Any uses?

Apple Watch in 2015

As an unintentional nod to one of the first wearables ever – the Nuremberg Egg which helped keep time in the 16th century – Apple came out with the Apple Watch in 2015. But this one's not just about telling the time. Not by a long shot. Using the product, one can make or take calls as well as

text and is integrated with iOS aside from other Apple products and services. And that's just the beginning of it.

Oculus Rift, slotted for 2016

The Oculus Rift is the latest in the series of wearables to enthrall the users. Said to be “the first really professional PC-based VR heasets” the device is a virtual reality head-mounted display developed by the company, Oculus VR. Having a resolution of 1080 * 1200 per eye, the Rift comes with integrated headphones that provide spatialised audio. It also has full 6 degrees of freedom in rotational and positional tracking. The product has come a long way since it was first proposed in a Kickstarter campaign and is one of the most anticipated tech releases.

From the humble beginnings as eyewear for monks to a head-mounted VR device which takes the concept of contrived reality to another level,
