

The new Pokémon game looks to integrate classic Pokémon gameplay with augmented reality

information regarding flight time delays and in-flights meals, etc. Really, your imagination is the limit with such a versatile tool.

Voice User Interface (VUI)

Arguably, the most intuitive method of communication for any human is voice. We learn to communicate using sounds from a very young age. However, communication is more than just learning a language; it is also catching slight nuances, understanding the variations in tone, pitch, and even recognizing the differences in accents. Problems like these were what plagued voice-recognition algorithms for years, and in turn, making it difficult for a real-world application of a voice-based user interface.

Fortunately, technology caught up, and we have more than capable voice-recognition software commercially available with a variety of real-world applications. The most popular one, Google Now, is almost sentient in its nature—constantly learning a user's likes and dislikes, providing suggestions with contextual information—it's almost like a personal assis-
