

Microsoft Pixelsense interacting with objects placed on it

the surface and then interact with content on the phone like view images and movies, make video calls, or simply access files stored on the phone on a much bigger interface for easy editing.

The earlier version of Pixelsense (aka Microsoft Surface 1.0; not to be confused with Microsoft's line of high-end laptop/tablet hybrids) used a near-infrared, 850-nanometer-wavelength LED light source that would react to changes near the surface by reflecting the light source to sensor cameras. However, this camera-based system was ditched for a more accurate pressure touch-based platform that could recognize fingers, tags, blobs, raw data, and objects placed on the screen. Microsoft rechristened this
