

# THE WAR OF THE WEARABLES

Analysing the current trend in wearables leads us to some unique revelations like their role in the enterprise space

Over the past half decade, wearable technology has seen a great surge in popularity as evidenced by its rising sales. From household brands like Fitbit and Android Wear to pioneering devices like the Oculus Rift and Google Glass, wearables look very much like they are here to stay. In the tech sense, “wearables” are electronic devices or miniature computers that are integrated into or made to resemble wearable objects such as watches, headbands, bracelets, rings – basically any piece of apparel that can be worn without hassle.

Applications for wearables have encompassed a number of fields. We’ve seen headbands fitted with EEG sensors for tracking brain activity and translating it into a format that can be used to drive peripheral hardware; in other words, using your brain to control pretty much anything that can recognize electronic signals. In fact, wearables are also being
