

Wearable tech shows great promise in sports and fitness

used in sports, a prime example of which is the MYOVOLT, a strap-like device that applies vibration energy directly to muscle, soft tissue and joints for physiological benefits.

With such a versatile range of applicability, there seem to be few markets that wearables are yet to penetrate. Finance analyst firm IHS predicts that from 2013 to 2019, the worldwide market for sensors in wearables will expand by 67 million units to a staggering 466 million units. This translates to an estimated increase in the number of wearable devices from 50 million to 135 million – that's a 170% increase or nearly 2.5 times in 6 years.

These numbers are a testament to the success of wearables in the commercial market. People are slowly getting interested in these unobtrusive devices that are slowly helping in making their daily lives just that little bit easier. Of course, it helps that most of these wearable devices are much more affordable than they were a few years ago. For instance, a developer kit for Google Glass would set you back a staggering \$1500. Definitely not for the casual tech buyer. Compare this with the now less than \$5 Google Cardboard – an almost primitive virtual reality headset made using over-the-counter materials such as cardboard, optical lenses, a
