

OUYA: Proof that not all successful Kickstarter projects end up as consumer favorites

and small-time engineers who want to see their revolutionary ideas brought to life but do not have the requisite funds to make it happen. In fact, Kickstarter has to be credited for bringing modern day wearables a household name. Enter, the Pebble smartwatch.

Built with an e-paper screen and designed to run with compatible apps on your iPhone or Android device, the Pebble smartwatch was arguably the world's first commercially successful smartwatch. For funding, Pebble turned to crowdfunding website Kickstarter, and it was not disappointed. In its first three days, the project attracted 18,867 backers and raised \$2,656,389 of their initial \$100,000 target, which successfully put the watch into production. The project eventually raised \$3 million in 60 days making it a runaway success and a great example of the effectiveness of Kickstarter.

It didn't stop there, however; the successor to the Pebble, aka the Pebble Time, also had its own Kickstarter campaign, which met its funding goal of \$500,000 in 17 minutes and crossed \$1 million in about 49 minutes, a Kickstarter record. It ended up as the most funded Kickstarter campaign reaching nearly \$14 million while still having 21 days remaining in its campaign.
