

Following the somewhat lukewarm reception of the Galaxy Gear, Samsung released six more wearables, namely the Gear 2, Gear 2 Neo, Gear Fit (which had more of smartband aesthetic), Gear Live (Samsung's first and only Android Wear based smartwatch), the Gear 2 and finally, the Gear S2.

When compared with the initial Gear smartwatches, the Gear S2 is very different in terms of design, featuring a circular display similar to that of the Moto 360. This gave it a reduced screen size of 1.2 inches as compared to the more immersive 2-inch display seen on the Gear S. Furthermore, the 3G version of the Gear S2 features a nano-SIM card slot unlike the painfully less supported e-SIM slot in the original Gear S, albeit this comes at the cost of the watch seeming bulkier. The Gear S2 also supports NFC, which should add tremendous functionality, especially if services like Android Pay and Samsung Pay pick up in popularity.

Both the Gear S and S2 house a 300 mAh battery that lends about 2 days of charge on average use. However, the Gear S does score some brownie points here since it supports magnetic wireless charging, unlike the original Gear S which required you to place the watch on a proprietary portable charging dock. All watches are also protected by Corning Gorilla Glass 3 and, as Samsung claims, also water-resistant up to a certain water depth and duration.

Moto 360 series

Initially, Motorola was seen as a surprise entry in the emerging wearables market, in particular, smartwatches. However, the success of the Moto 360 helped cement their position as a major player in the smartwatch market. In fact, before its release, the Moto 360 was the biggest draw in a number of technology conference and showcases, owing in particular to its one distinguishing factor, its compact and very sleek circular display. Also, Motorola managed to reduce the size of the bezel to a bare minimum unlike the other clunkier smartwatches in the market. However, this sleekness came at a cost, as Motorola had to house the driving hardware for the display at the base, which left the watch with an annoying black bar at the bottom of the watch face.

Motorola introduced significant upgrades in the 2015 edition of the Moto 360, most notable of which was the new 'ambient mode' display. In this mode, the display of the watch face is always on, similar to other smartwatches available in the market. In the original Moto 360, you could only view the display either by physically lifting your wrist and looking
