

tracking as well as a digital display that doubles up as a digital clock or a dynamic stat tracker. The One is slightly bigger in size and adds the auto sleep tracking feature as seen in the Flex. All Fitbit variants are water resistance, which is important considering they are aimed at fitness enthusiasts, which means it has to endure sweat and water on a daily basis. They can be synced wirelessly to your computer using the provided dongle, or you can opt to sync it with your smartphone via Bluetooth.

### **Garmin Vivofit**

The Vivofit's features and design greatly resemble that found in the Fitbit Charge. It counts steps, tracks distance traveled, and shows estimated calories burned. It also shows how many steps are left towards your daily goal. It includes sleep tracking and can check continuous heart rate if connected with an ANT+ wireless heart rate monitors. These can be purchased separately or bought bundled in with a Vivofit at a overall discounted rate.

The Vivofit has a very minimal design and features rubbery plastic band that clip the band shut with little pegs. The LCD display is always on and greatly resembles an old-school digital watch with its black background and grey digits. The user interface is controlled using a single button, whose function differs depending on how long it is pressed down.

The main draw of the Vivofit, however, has to be its tremendous battery life. Garmin promises up to a year's worth of battery life on a single charge. It's closest competition in this factor is the Fitbit flex, whose replaceable battery lasts up to 6 months. It's only drawback in this aspect is that the battery is not rechargeable and has to be replaced by unscrewing the back housing, similar to that of a standard wristwatch.

The Vivofit syncs with your phone via its own app, which is available for Android and iOS (sorry Windows phone users) and features a simple interface that may not be packed with features but gets the basics done. Garmin has also incorporated social features into the app, allowing you to compare your fitness stats with that of friends and other Vivofit users. Unfortunately, the smartband is not compatible with other fitness apps which may put off long-time users of apps like Runkeeper or MyFitnessPal.

The Vivofit's successor, the Vivofit 2, includes some much needed improvements that were lacking in the original. It adds back light allowing you to check stats even in dimly lit conditions. This means the Vivofit 2 can be considered a proper watch replacement. The original Vivofit included
