

The Vive features two 1200 x 1080p HD displays, both operating at a refresh rate of 90 Hz. It features an integrated accelerometer, gyroscope and laser positioning system, all of which collectively lend much more accurate head tracking: up to one-tenth of a degree in any direction. The Vive will also include native support for the Steam controller, contextually aware controller that aims to allow users to intuitively move about and interact with objects in the virtual world.

HTC plans to set itself apart from the competition by designing the Vive with unprecedentedly low levels of latency and smooth 360-degree tracking. They are also adding the ability to detect movements as the users walks in a 15 x 15 square feet area. This promises a more immersive VR
