

that's missing – you can also use a wearable emulator instead of having a wearable device actually connected but would require an android device connected to the computer.

The Platform

On the software side to design applications for wearables, just like smart-phones, phone operating systems provide a free platform for wearable apps development.

On the hardware front, smartwatches come with Wi-Fi support and with some like the Samsung Gear S, you get to add on a SIM card and use 3G data connection directly from the smartwatch instead of communicating via the phone.

Android provides you the ready made platform to design apps known as Android studio (<https://developer.android.com/wear/index.html>) and Apple provides you with its WatchKit(<https://developer.apple.com/watchkit/>). They come with complete guidelines on the website to provide you step by step help. Third party applications like proto.io, pixate and Thinkapps also let you make prototypes for your smartwatch. Justinmind provides you with
