

ready made templates for resolutions that are standard for popular devices for you to get started quickly. The best part about using Justinmind is that you do not need to know coding to use these. Simply, drag and drop elements!

Let's get you started with making the apps. The most basic and fundamental principle to design an app are discussed below. Before starting to code, you need to have these points clarified: what is the purpose of the app? What would it include? How would it work? Could it be interactive or just a single screen app is better?

Interactive pattern

The wearables interact with you in two ways. Either they suggest something that they assume you would be interested in and the second way is to accept your commands. It is very necessary to correctly know what kind of an app you want to build and the approach you want to take. The latter would let

Notifications to be pushed to wearable from the phone

the user control when to launch the application and give him full control to choose the command whereas the notifications or suggestive cards could be timely and are short, easy to read and require minimal interaction with the user. Say notification cards like updates about IMs, mails, stockmarket/scores/weather updates etc. The apps that execute a user initiated action are mostly controlled via voice and could include commands like making a call, setting a reminder, taking a note, sending a message etc.

Design principles and the look

You would have now decided what your app needs to do. In this section we
