

focus on the look and feel. Beauty may be only skin deep but it's important. An app which is just a notification card can have a background image and the card floating on a part of the screen, preferably on the bottom. It generally has the app icon to state the card is pulled out by which application. It has the notification title and the text. Keep in mind that the real estate you are working with is pretty small.

There are some things you should keep in mind. Firstly, you should use pop ups sparingly. The text usage should be frugal. These development software also allow you to add multiple notifications cards, so if you want to go ahead with that or just stick to one notification card is your choice. Some other principles should be kept in mind: any command should be completed in maximum of 5 or 7 seconds. For example, say setting up an alarm would take one screen to let you set the alarm time that provides you options of the numbers or the clock, the second one could be probably asking for the snooze time duration and the third one can be an auto confirm screen.

You also need to decide your primary way of navigation. If you want to give buttons which can be tapped to go to next screen, or a swipe would be better or you could just do with the newest voice input. Again, it is indeed important to keep as minimum screen navigation and minimum steps to

Using the SDK Manager for API download

get an action done. No one wants to go through 10 screens to set an alarm when it can be done with just one or two simple voice commands.

Another interesting feature that can be used and integrated into apps for wearables could be automatic launching of an app when it detects a location or at a particular time everyday. If you commute at a specific time daily, probably the app could launch and give you traffic update of your possible route or probably every night at a specific time it could remind you to make note of meetings of the following day.

Hardware is minimum and can vary on all wearables. The Apple Watch gives you an advantage of scrolling using its digital crown whereas the
