

Samsung Gear S lets you navigate or scroll between apps using its radial dial which is a rotational bezel around the screen. These wearables come with a number of sensors built in. It is you who has to decide what sensors you would want to use based on the nature of your app. For example, an app related to fitness would be using the data provided by the heart rate sensor built in.

A very important point that needs to be noted is that smartwatches have tiny screen and low processing power. It is always advised to keep the apps light in size and minimal in the content as well as design. It is what you or rather your app can do in that minimum space and processor speed provided is the main target. For example, Smartwatches do not, or rather cannot feature a keyboard and it is just the voice command which is the only primary input method.

As per the Google Wear Design Creative Vision section there are four key things to keep in mind when designing Smart Wear experiences. These Wear applications should:

Available	Reserved for System					Blocked
 Can be used for aesthetic changes, activity launches and inline expansion.	 Used to navigate the notification stream.	 Used to open the cue card.	 Used to open the quick settings shade.	 Used to open the watch face picker.	 Reserved for the system.	No other gestures are available, e.g. - Pinch - Spread - Multiple taps (double, triple, etc)

Available gestures

Launch automatically: Wear devices are wearables and an extension to the phone, and not a phone by themselves. The apps need not be started by the user but launch automatically on being aware of the context, location time and activity and should be capable of inserting the relevant card accordingly.

Be “glanceable”: These wearables serve the main purpose of notifying you instantly without looking at your phone and thus need to be with minimal information which could be read and be done with. Notification cards just have the title, description- the notification text and the app icon. That’s it! Keep it to a minimum- easy to read at a glance and relevant.

Effective Suggest and Demand: The Android Wear developer page suggests, “Android Wear is like a great personal assistant and it only inter-
