

rupts you when it is absolutely necessary, and it's always reachable easily to provide a ready answer.” To deliver this efficiently, the developer should accurately know when does the app need to suggest and when does it demands user's attention.

Interaction with the user: Owing to the small display size of these wearables, it is very important to have an efficient as well as simple way to interact with the user. Probably have tap or gestures, have voice command as your primary input type and check out the automated confirmation way to confirm an action rather than making the user need to tap on the Yes/No button on the confirmation question

The Android Wear Design team has done a great job in documenting how to effectively integrate their design philosophy when creating wearable extensions of your existing Android applications. Check out the design section of Android Wear here: <https://developer.android.com/design/wear/principles.html>

Square or Circle?

Wearables come in two shapes as of now. They are either circular or round like the Moto 360 watch or square – like the Apple Watch or the Samsung Gear S. The square screen is 280 pixels x 280 pixels and the round screen is 320 pixels x 320 pixels, both having a density of hdpi (240dpi). To get your layout perfect on any devices you can either define specific layouts for square as well as round devices and let the app automatically detect the shape and choose the appropriate layout or the second way is that you can also use a special layout for the round or the square watches that would be included in the library itself. The layout applies different window insets depending on the shape of the device screen. It is advisable to go with the different layout option and often the most chosen way to go ahead with. It would not take a long time as the assets and other files would already be ready and just need to be placed in the additional layout. You can also go ahead with the second option if you want to use a similar layout on both screens without having the view cropped near the edges of the round screens.

It is really easy tweaking your screen layouts for the shape that you want to design it for. All you need to think of is the layout designs to fit in your content.

As of now, Apple WatchKit allows you to design only on a rectangular layout as their watch itself is rectangular in shape but the Android Wear
