

A BRAVE NEW WORLD

Gadget evolution is truly exciting now

Wearable- An item that can be worn.

Wearable Technology- Electronics that can be worn on the body

The terms “wearable technology“, “wearable devices“, and “wearables” refer to electronics; gadgets or computers that are integrated into clothing or accessories that can comfortably be worn on the body. These wearable machines can perform some of the same computing tasks as mobile phones and laptop computers and in some cases, wearable technology can surprisingly surpass these devices entirely. Wearable technology, these days, tends to be more sophisticated than hand-held technology on the market as it can provide atypical sensory and scanning features that are not seen in mobile or laptops, like biofeedback and the tracking of such things as physiological function. Not to mention how they come in handy, pocketable sizes. One of the major features of wearable technology is its ability to connect to the Internet, enabling data to be exchanged between a network and the device.

Much has changed since Atanasoff and Berry invented the first computer, the Electronic Numerical Integrator and Computer. Modern computers have become smaller, more efficient, and more powerful while simultaneously occupying much less space than ever before. Before ogling at the magnificent(?) Google Glass and looking forward to the future of wearable tech, let
