understand what the future could possibly hold. Will humans be merged with technology to evolve into cybernetic organisms? Could this be the ultimate version of our species? Or will the human-machine evolution culminate with augmenting human ability such as by heightening our memory and olfactory functions? Someone wise once said that you must know your past to master your future. Let's do this by reflecting on the chronology of wearable tech's development.

Wearables of the past

Our inspiration for wearables started with Queen Jane Seymour's arm watch (as it was called at that time), followed by the Ming Dynasty's 'Ring Abacus'. The Father of Modern Wearables, Steve Mann was the visionary who brought forward the era of high-end programmable wearables such as backpacks, helmets and eye glasses in the late 1980s itself.

Steve Mann questioned the rationale of buildings having more rights than an individual, or of candy on a store shelf needing more surveillance than an individual. The inspiration for the digital eye glasses concept came
