

from Mann's desire to help the human race protect itself with the same tech we're so diligently protecting non living entities with.

Another pioneer and visionary in the world of wearables is Kevin Warwick, a Professor of Cybernetics at Reading University. He laid the foundation for wearable implants by showing the world that we can streamline our day-to-day activities by integrating tech into the human body. In 1998, Warwick became the world's first cyborg after implanting an RFID chip in his arm. Now, regulated RFIDs are implanted into patients with medical conditions, so that healthcare workers can easily access their medical history in case of emergencies and administer medication without having to undergo a grueling amount of tests and other procedures, which can further endanger the patient's life.

Wearables of the present

At present, based on the targeted functional group, wearables are generally categorised into two types:

1. Enterprise Solutions: Wearables that are just an add-on to existing technology to facilitate your daily human-tech interaction are enterprise solutions. Compared to the other category, enterprise solutions have seen more development in recent times. Enterprise solutions today include smartwatches and other similar product categories which allow real-time tracking of events.

2. Medical Tech/Health Monitors: Though this is an upcoming category, we've all already seen many examples of healthcare wearables – be it prosthetics and exoskeletons for the handicapped or fitness trackers that track your health and sleep habits.

Wearables of the future

As we move to the future of the wearables, we see the categories explode into many more possible trajectories to travel on. Some we can categorise on the basis of current market trends from the application point of view:

- ♦ **Activity Monitors:** These are wearables that have direct contact with the human body for data collection that helps monitor the functioning of the body and track vital signs. These are some types of activity monitors:
- ♦ **Smart Clothes:** Includes smart shirts, smart socks, smart footwear etc.
