

which allows her to sense earthquakes anywhere on the planet.

How high is the possibility of plugging your brain into a network? Of upgrading your brain? Is your brain functioning at its utmost capability? Kevin Warwick answered some of these questions with his 'BrainGate' implant system (also called the 'Utah Array'), which is a bi-directional interface. The interface picks up the neuro signals of any body activity and transmits it to another device to control it and vice-versa. In case of Kevin, he transmitted his hand movements to a robot hand kept a continent away via the internet.

So what's the basic difference between the two? While Neil used wearables to rectify his medical shortcoming and showed us the potential of wearables from the application point of view, Kevin pointed us towards an entirely new frontier of the human evolution. He not only brought forward a new way to advance our prosthetics and medical tech, but also showed us new ways to enhance our human abilities to a whole new level, such as by enabling communication between two nervous systems, or in layman's terms communication by thought alone. Kevin Warwick basically laid the foundation stone for what we nowadays call 'biohacking'.

Natural vs. Cyborgism vs. Wearables

Some people may argue that cyborgism is not natural. But can we really define what is natural anymore? By its definition, the term "natural" can be defined as something existing in nature and not made or caused by people or have any extra substances, chemicals or artificial components.

That being said, are we really natural? If so, then what about all the vaccines that are injected into an infant to improve immunity? The natural course of action would be to not vaccinate, because that's the way we naturally exist. What about all the medical treatments we receive for the many diseases, which would otherwise be incurable naturally (like cancer and TB).

So we can conclude that it's the natural human tendency to try to evolve.

Cyborgism would be the ultimate evolution for the human species in the near foreseeable future, whereas wearables are the catalyst to that future, because the fusion between human and technology is the one-stop solution to reach the pinnacle of intellect.

A day in the life of a wearable enthusiast

Are you a wearable enthusiast? Don't know if you're one or not? To figure this out, let's look at a normal day of a wearable enthusiast. Our enthusiast is
