

but not limited to, the growth of technologies) tends to increase exponentially. Also Moore's Law contends that as components get smaller, products gain efficiency and become more powerful.

In other words, you can think of current wearables as a boombox on your wrist. Conductive fabrics and sensor-clad smart garments will enable wearables to intertwine so closely with fashion that we won't be able to tell them apart.

Our expectations

We expect future wearables to be more concealed than they currently are. This could probably be done by adding a thin film inside your favorite jewelry, which could measure biometric data and activity levels, and alert you when you've been typing at a keyboard for too long. We're excited to see what happens when wearables converge with connected homes to drive efficiencies without having to tap a button on a screen. Imagine approaching your home's door with groceries in hand, and the heartbeat signature via your wearable signals the door's smart lock to unlock.

While crossing your living room, a sensor on your wrist wearable notices your core body temperature is above average and automatically interacts with Nest thermostat to trigger the air conditioning. Your wearable also includes a sensor to detect hydration levels, which notifies your smart refrigerator to automatically pour you a glass of water as you enter the kitchen to unload your groceries.

Business prospective

From wedding rings to braces, objects worn on the body 24/7 tend to be personal. Unless the product addresses a critical medical need like a hearing aid, it's unlikely for a single wearable to be desirable enough to be worn all the time. So with all signs pointing to wearable technology as the next big thing, businesses should have a game plan in place to act on the competitive opportunity, while taking note of the challenges. Among the considerations to keep at the top of their mind are the following:

1. Envision How Wearables Can Create New Business Opportunities:

The rise of wearable devices will create new means for marketing, including smarter, more robust customer data collection and stronger insights into user interaction.

2. Keep Human-Centered Design at the Forefront of Your Strategy:

To effectively embrace wearable technology, businesses must put the user at
