

Google Cardboard: it's easy and affordable

While all these massive players are looking forward to bring VR to every home, the task lies to develop the core technology. As all the games that will be linked with the headsets are going to be location based, it has to be precisely designed.

The market needs a sense of presence and only VR can bring it. That sense, where you can do anything- hunt a zombie, be to places where you have never been. That sense where you feel to go back and again with time. It can only be possible with VR and when it does become possible, it will be technology's biggest conquering.

Like we use cell phones today, there will be elements of Virtual reality in future homes. As soon as the mega-players in the technology market get there, the time when we can access everything virtually is not too far. In celebration of VR's rise, we presented a glimpse of the enormous prospects that it holds.
