

- ◆ **Waist harness** that provides stability for unconstrained movement in the VR world.
- ◆ **Virtuix Omni shoes** that are low friction shoes designed to work well with the platform.
- ◆ **Omni Tracking Pods** that can be attached to the shoes for low latency motion detection
- ◆ (optional) **Virtuix VR rack** that can be used to keep your controllers, guns and almost anything else that is supported by the headset you are using

The entire package comes at a combined price of \$699 and is all yours to get if you are willing to shed that kind of money. Not anytime soon though. Perhaps by then you can get a Rift or Vive to use with that.

The Morpheus out of Matrix

Sony's interest in VR dates back to the 90's. Anyone remember Sony's Glasstron? This VR headset perhaps has been the most used in stock photos depicting VR before Rift arrived. It was released to the US markets in 1997 and was mainly used with the game MechWarrior 2, where the player could experience being in the cockpit of a craft in the middle of the battle.

Project Morpheus was introduced to the world in the 2014 Game Developers Conference (GDC). Sony revealed that work had been ongoing since the past 3 years, and the PS move controller had been designed with a future VR HMD in mind. In 2015, the project was renamed to PlayStation VR and the prototype demoed at GDC 2015 had an OLED display with 960x1080 resolution per eye and was capable of 120fps along with the standard 100 degree FOV, 6 Directions of Freedom Head tracking and stereoscopic 3D. The processing is still handled by the connected PS4. One of the interesting features of the PlayStation VR is the ability to generate two separate displays for the headset and a TV connected to the console. Sony's purpose behind this is to prevent VR from becoming an essentially lonely experience.

Sony, most likely, has the most exhaustive list of games ready for the PS VR platform, both due to their efforts and the huge developer community around the PlayStation platform. Take the example of Keep talking and Nobody explodes. In this game, one player puts on the VR HMD and can see a time bomb in front of them. Another player, in front of a TV screen, can see an instruction manual about the bomb. The second player has to explain what the first player needs to do, without either being able to see the other's screen. That is truly a social experience at gaming.
