

200Euros, or roughly Rs.15,000/-. About the compatibility, the Gloveone is compatible with the Rift, Leap Motion, OSVR, SteamVR, Intel RealSense as well as Kinect. Check out their official documentation page at <http://digit.in/GloveOneDoc> for C/C++ APIs as well as other helpful documentation related to Unity Engine and Unreal Engine.

HTC Vive with SteamVR: Not the first, maybe the best?

HTC and Valve have been working together on a VR product since 2015. Initially, HTC had approached Oculus but was refused collaboration. A lot like Valve's Steam Machines concept, SteamVR is aimed as a collaboration with several hardware manufacturers, the first and the only one as of now being HTC with its Vive headset. It is not a surprise that the entry of one of the world's biggest game distributors, and a significant developer in its own right, into the VR field has excited gamers all over the world.

The initial versions of the Vive were quite bulky. That changed as the Vive Pre was demoed at CES2016. The device was noticeably smaller and redesigned with the consumer in mind. Yes, you can wear it with your spectacles on! Point to be noted is that the HTC Vive is another wired HMD as of now and will require stepping over the wire from time to time. Also, the device does not contain integrated headphones, a fact that HTC intends to change in the final consumer edition.

HTC and Valve's collaboration might prove to be the disruptor in this field even before things are set in motion
